EXPLANATION OF THE TASK

Day 26 — PHP Client Intake Desk

Internship Task Documentation

Project purpose

I built a small client intake workflow instead of stopping at a basic form example. The idea was to practice PHP fundamentals in a situation that resembles a real internal business tool.

How it works

The form sends a POST request to process.php. The server trims and validates each value, checks the CSRF token, and stores a concise result in the session before redirecting back to the form.

Security and reliability

The application validates the email with `filter_var`, restricts the priority to known values, limits text lengths, escapes displayed content with `htmlspecialchars` and protects the POST endpoint with a session-backed CSRF token.

UI decisions

I used a responsive card layout, clear labels, sensible field limits, focus-friendly inputs and visible feedback. The design is deliberately simple so the PHP fundamentals remain easy to inspect.

What I learned

A form processor is not only about reading `$_POST`. A professional implementation also needs validation, safe output, CSRF protection, predictable feedback and separation between presentation and processing.

THANK YOU!
