DAY 27 - LARAVEL

Building with Laravel Routes & Controllers.

This application demonstrates how Laravel handles incoming requests through routes, controllers, and Blade views. The structure is kept clean so that new features can be added without making the application difficult to maintain.

Explore the Architecture →

← Back Home

Laravel Architecture

This Day 27 application focuses on the foundation of Laravel development: routing, controllers and Blade views.

Instead of putting application logic directly inside routes, requests are delegated to a dedicated controller. This keeps the application organized and makes it easier to expand later.

127.0.0.1:8000/projects/Task%20Manager

PROJECT ROUTE

Task Manager

This page demonstrates Laravel route parameters. The project name is captured from the URL and passed from the route to the controller and finally into this Blade view.

EXPLANATION OF THE TASK

Day 27 — Laravel Project Pulse

Routing and Controllers · Internship Task Documentation

Project purpose

I created Project Pulse to understand Laravel request flow in a practical application. Routes describe entry points while ProjectController contains the request-specific behavior.

Route design

The project uses named routes, a projects prefix and a route parameter for project slugs. Invalid project slugs return a 404 response rather than an empty page.

Blade structure

A reusable Blade layout contains the header, navigation and footer. Individual pages extend that layout and focus only on their content.

UI decisions

The interface uses responsive cards, strong hierarchy and restrained styling so the application feels like a small product while remaining dependency-light.

What I learned

Named routes make navigation maintainable and controllers prevent the routes file from becoming a collection of application logic.

THANK YOU!
